Generative AI Applications

Beyond the Prompt: Building Scalable AI-Powered Solutions

At BREW, we specialize in developing robust Generative AI applications that deliver real-world value. We move beyond the hype, focusing on the engineering and infrastructure required to launch AI solutions that can serve thousands of users concurrently.

Our expertise lies in harnessing the power of both open-source and commercial models to build custom AI-powered systems. Whether your project requires training a model from the ground up or leveraging existing platforms, we tailor our approach to meet your unique business needs.

We build sophisticated applications that are far more than just a wrapper around an LLM. Our capabilities include:

AI-Powered Agents: Developing autonomous agents that can perform complex tasks and interact with users in a dynamic and intelligent way.

Data Pipelines: Implementing LLM-first data pipelines to provide your applications with access to your proprietary data, ensuring more accurate and context-aware responses.

Research Agents: Building agents that can conduct research, analyze data, and provide insights to support your business decisions.

Scalable Infrastructure: We don't just write prompts; we build the necessary job queues, API layers, and backend infrastructure to ensure your AI application is reliable, scalable, and ready for production.

We undertook many projects throughout the world. We are helping many companies push their businesses forward, serving clients in entertainment, retail, automotive, education, finance, and information technologies.
